

## Exercise 2 - Cards

Using only HTML/CSS, create a single webpage that changes its appearance as you switch between different screen sizes.

### Example

<https://kaz-at-cca.github.io/interactive1/exercise2/index.html>

### Technique

You will be using `@media` queries to define how content changes based on the user's screen dimensions.

### Code to Use

`@media`

### Instructions

1. [Copy & Paste the source code from this page](#) to Sublime Text. Save this file as 'index.html' file in a folder named 'exercise2' in your root directory.
2. Add this viewport code between the `<head>` section to enable media query:

```
<meta name="viewport" content="initial-scale=1.0, width=device-width" />
```

3. Add these `@media` queries breakpoints at the bottom of your `<style>` section:

```
@media screen and (min-width: 768px) {  
  
}  
  
@media screen and (min-width: 1200px) {
```

```
}
```

You can add more breakpoints if you want.

4. Add styles for each breakpoint and try adjusting your browser to view your changes.
5. Add your own image and text to complete the exercise.
6. Once you are done, link it to your class website as “Exercise 2 - Cards”
